

GET vs POST

Internet Programming - CSA4308

Adhil Bijukumar - 192411133

The Analogy

GET

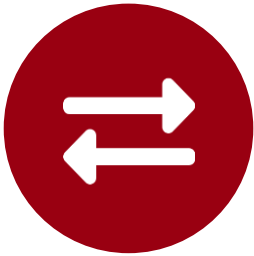

= Postcard
visible to all

POST

= Sealed Envelope
private

The Core Idea

Both GET & POST are request → response — always two-way

Server always sends something back

The real difference:

- **Where the outgoing data sits**
(URL vs body)
- **Why you're sending it**
(fetch vs submit/change)

GET Method

Data appended to the **URL**

```
?key=value&key2=value2
```

Example: `google.com/search?q=biryani`

-
- Visible in URL / browser history
 - Limited size (~2000 characters)
 - Bookmarkable & shareable
 - Best for: fetching / searching data

POST Method

Data sent in the **request body**

URL stays clean – no data visible

Example: `college.edu/login`

-
- Hidden from URL
 - Large size limit (supports file uploads)
 - Not bookmarkable
 - Best for: login, payments, sensitive/large data

Comparison

////////	GET	POST
Location	URL	Body
Visibility	Exposed	Hidden
Size limit	Small	Large
Use case	Search	Login / Payment

Real-World Examples

GET

- Google search
- Flipkart product link shared on WhatsApp

POST

- UPI payment
- College login
- File upload

Thank you
